Hi Adam,

Ezra here from Our Place. Thank you for reaching out. I'd be more than happy to help you with this.

To start, the stainless steel components of the Large Wonder Oven (including the base, crumb tray, and air fry basket) are made from food-grade stainless steel and chromed steel that undergo rigorous third-party testing to confirm there are no detectable levels of lead, cadmium, or other heavy metals that could leach or migrate during normal use. All of our products are fully compliant with California's Prop 65, FDA, and European LFGB regulations, which have some of the most stringent safety standards in the world.

While trace elements such as iron, chromium, and manganese are naturally part of stainless steel's composition (they're what make it durable and corrosion-resistant), these are stable, bound metals, not free or leachable lead. In other words, there is no added lead in our stainless steel, and no measurable lead release from any component..

Also potentially of interest, the [California's AB 1200](#) Disclosure requires manufacturers of listed cookware to make certain disclosures about their products based on whether certain chemicals are intentionally added to the products' food contact components and handles. You can read more about it here! Please rest assured, we have no reason to believe that any of our products present a health risk.

I hope this helps! Please let me know if there's anything else that I can help you with.

Best,
Ezra
Our Place
